

NYC Taxi Streaming Pipeline — Validation Report

Execution status

This packaged report is a submission-ready report template generated from the required validation logic. Final numeric layer counts are environment-dependent and are populated by validate.py after PostgreSQL, Kafka and Spark are executed. The package does not fabricate runtime evidence.

Required reconciliation

Bronze = Silver + Quarantine + Deduplicated. Silver must contain no null trip_key, no duplicate business keys, no invalid location IDs, no negative fares, and fact_trips must equal Silver row count after idempotent loading.
